Hooks:

1. Program to write ISR for “DIV BY Zero” exception i.e., INT#0 and hook it to print custom message “Cannot be divided by 0”.
2. **Write an assembly language program to hook the *Overflow Exception* (INT 4).**
   The program should modify the Interrupt Vector Table (IVT) so that a **user-defined Interrupt Service Routine (ISR)** is executed whenever an overflow condition occurs.
3. **Write an assembly language program to hook interrupt 0x65 with multiple user-defined services.**The custom Interrupt Service Routine (ISR) must **preserve all registers except AX**.
   The interrupt should provide the following services, selected using the value in the **AH register**:

Service Code (AH)	Description
0x01	Add two words pointed to by **SI** and **DI** and store the result in the memory location pointed to by **BX**. **[BX] ← [SI] + [DI]**
0x02	Multiply two words pointed to by **SI** and **SI** and store the result in the memory location pointed to by **BX**. **[BX] ← [SI] × [DI]**
0x03	Divide the word pointed to by **SI** by the byte pointed to by **DI** and store the quotient and remainder in registers **AL** and **AH**, respectively. **AL ← [SI] / [DI]** **AH ← [SI] % [DI]**
