

Lab manual 7

Task 1:

AX = 1234h
BX = 5678h

Use the stack to **swap** their values (WITHOUT MOV AX, BX).

Use only PUSH and POP.

Expected Result:

After your code:

AX = 5678h
BX = 1234h

Task 2:

You have an array:

```
arr db 1,2,3,4,5
```

Push all 5 values onto the stack, then pop them into another array:

```
rev db 5 dup(?)
```

Expected Result:

rev should contain:

5,4,3,2,1

Task 3:

Write a procedure:

sum3 PROC

Main should push:

push 5

push 10

push 20

Procedure should:

- Access parameters using BP
- Add all three
- Return result in AX

(do not use pop)

Task 4:

Access the 3rd Value from Stack Without Using POP

Task 5:

Write Procedure That Finds Maximum Number from an array.

Task 6:

Write Procedure That Finds Minimum Number from an array.

Task 7:**Sum of Odd Numbers in Array Using Stack**

Push array base address and size. Procedure should sum only odd numbers and return the result in AX.
