

Q1. Character Input with Echo

Write an assembly language program that reads a single character from the keyboard.

The program should display the same character automatically on the screen and then terminate.

Q2. Character Input without Echo

Write a program that takes one character input from the user **without displaying it on the screen**.

After input, print a message saying that the character was successfully received.

Q3. Printing a Single Character

Write a program that prints a single character # on the screen. The character must be passed through the correct register before calling the interrupt.

Q4. Displaying a String

Write a program that displays the message **“WELCOME TO ASSEMBLY”**.

Make sure the string is properly terminated and stored in the data segment.

Q5. Password-Style Program

Write a program that asks the user to enter a password(no echo).

If the entered character matches a predefined value, display **“ACCESS GRANTED”** on the screen.

Otherwise, terminate the program.

Q6.

Write a code that inputs a 16-bit integer number in hexadecimal radix from the keyboard and store it in a variable.

Q7.

Write a code that prints a number stored in a 16-bit variable on screen in a hexadecimal radix.

Q. 8. Displaying Character with Color

Write a program that displays the character * **five times** on the screen. The character should appear in **red color** on the default video page.

Q9. Cursor and Character Combination

Write a program that first moves the cursor to the middle of screen. then prints a string "Hey emu" at that position.
