

Graded Lab 3

Write a **C++ program** to model the relationship between an **Employee** and a **Company** where an employee can be associated with a company **without being owned by it**.

Program Requirements:

1. **Class Employee**
 - o Data members:
 - empId
 - empName
 - o A constructor to initialize the data members.
 - o A member function displayEmployee() to display employee details.
2. **Class Company**
 - o Contains a pointer to an Employee object.
 - o Provides a member function assignEmployee(Employee*) to associate an existing employee with the company.
 - o The class should **not create or destroy** the employee object.
3. **Memory Management and Behavior Conditions**
 - o The Employee object must be created using **dynamic memory allocation**.
 - o The Company class must **only refer to the employee**, not manage its lifetime.
 - o When a Company object is destroyed, the Employee object must **continue to exist** and remain accessible.
 - o Demonstrate this behavior in the main() function by:
 - Creating an employee
 - Assigning it to a company
 - Destroying the company
 - Showing that the employee still exists and can display its details
4. Write a **complete and executable C++ program** that fulfills the above requirements.
